

Installation and Usage:

Because CodePanorama is available as a web application, it stands out for its easy accessibility and user-friendliness. As a result, customers with an online connection can access the tool instantly without the requirement for local installations. CodePanorama offers a self-hosted solution for users with certain privacy or security requirements. This option gives users flexibility when evaluating private repositories or projects that are kept in local directories. The tool's user interface is simple to use, requiring little effort from users to select repositories, customize images, and apply different overlays and filters. CodePanorama's adaptability is further enhanced by its language-agnostic design, which guarantees that it may be used for a variety of programming languages and even non-code projects like technical documentation.

Benefits:

The primary benefit of CodePanorama is that it allows you to inspect code through pictures. As a result, developers can quickly identify problems, common patterns, and possible areas for improvement in their code without having to examine every last detail. This visual approach simplifies reviewing by turning code into large pictures and helps identify issues that may go unnoticed by standard code checks.

CodePanorama is great because it provides you with a new point of view on your code, which facilitates comprehension. It is ideal for both individuals who write code and those who teach it because it is easy to use.
